FNP Gifting Sales Analysis (2023)

An interactive Excel dashboard on revenue, products, occasions, cities and delivery speed for an online gifting business

Project type	Portfolio project built on a public practice dataset themed on FNP (Ferns N Petals); not real FNP or client data
Tools	Microsoft Excel: Power Query, Data Model (3 related tables), Pivot Tables, Charts, Timeline and Slicers, formulas
Data	1,000 orders | 100 customers | 70 products | orders placed 1 Jan to 29 Dec 2023 | values in INR
Author	Abhijit Sharma, B.Tech Computer Science (Data Science)

1. Executive summary

This project analyses 1,000 gift orders from an online gifting business modelled on Ferns N Petals. Revenue was **₹35.21 lakh**, with an average of **₹3,521 per order** and **5.53 days** to deliver. Revenue is strongly seasonal: four festival occasions (Valentine's Day, Holi, Raksha Bandhan and Diwali) generate **52.6%** of annual revenue, and February, March, August and November together deliver **68.2%**. Colors, Soft Toys and Sweets account for 70% of revenue, and delivery time does not depend on order size.

₹35,20,984	1,000	₹3,521	5.53 days
Total revenue (₹35.21 lakh)	Orders	Average value per order	Average delivery time

2. Problem statement

An online gifting business sells across many occasions and depends on timely delivery. Management needs to know **which products, occasions, cities and months drive revenue, and whether delivery is consistent**, so that stock and marketing can be planned around peak dates. The data sits in three separate tables (orders, customers, products) that must be combined before any meaningful analysis is possible. The goal of this project is one dashboard that joins them and answers these questions.

Business questions the dashboard answers

1. What are total revenue, average order value and average delivery time?
2. Which product categories and individual products bring the most revenue?
3. How does revenue change across months and across the hours of the day?
4. Which occasions drive the most orders and revenue?
5. Which customer cities place the most orders?
6. Is delivery time related to the quantity ordered?

3. Dataset

Source	Public practice dataset themed on FNP. Records are synthetic (placeholder names and product descriptions), so findings illustrate the analysis method rather than real FNP performance
Tables	Orders: 1,000 rows | Customers: 100 rows | Products: 70 rows (7 categories, 7 occasions)
Coverage	Orders placed 1 Jan to 29 Dec 2023; deliveries 2 Jan 2023 to 7 Jan 2024; 86 customer cities
Quality checks	No duplicate order IDs; every order matches a product (0 unmatched); no blank cells

4. Solution process

1. **Import with Power Query.** Loaded the three CSV files (orders, customers, products) as Power Query queries into Excel tables and the Data Model.
2. **Build the data model.** Related the tables through Customer_ID and Product_ID so a single pivot can combine order revenue with customer city and product category.
3. **Create calculated fields.** Price (INR) from the product table; Revenue = Price × Quantity; Time Taken to Deliver = delivery date minus order date (days); Hour of Order; Hour of Delivery; Weekday of Order; Month Name.
4. **Summarise with Pivot Tables.** Built ten pivot tables covering the KPIs, revenue by category, product, month, hour and occasion, and orders by customer city.
5. **Choose the right chart for each question.** Bar charts for category, product, city and occasion comparisons; line charts for the month and hour patterns.
6. **Add interactivity and assemble the dashboard.** Added Timeline slicers for Order Date and Delivery Date and a slicer for Occasion, then arranged the KPI cards and six charts on one branded sheet.

5. The dashboard

Figure 1. FNP Sales Analysis dashboard: three KPI cards, six charts, two timeline slicers and an occasion slicer.

How to use it: drag the Order Date or Delivery Date timelines, or click an occasion, to refresh every chart and KPI for that period or occasion.

6. Key findings

1. **Revenue is driven by four festival peaks.**
February (₹7.05 lakh), March (₹5.12 lakh), August (₹7.37 lakh) and November (₹4.49 lakh) together deliver **68.2% of annual revenue**; the other eight months earn only ₹0.95 to ₹1.58 lakh each. The peaks match Valentine's Day and Holi (February to March), Raksha Bandhan (August) and Diwali (November), and these four occasions alone bring **₹18.52 lakh, or 52.6%** of revenue.

2. **Three categories make up 70% of revenue.**
Colors (₹10.06 lakh, 28.6%), Soft Toys (₹7.41 lakh, 21.0%) and Sweets (₹7.34 lakh, 20.8%) lead. Soft Toys (₹4,463) and Sweets (₹4,291) also have the highest value per order, while Plants (₹2,144) have the lowest. Cake, Raksha Bandhan items, Plants and Mugs share the remaining 29.6%.

3. **No single hero product.**
The top 10 products earn between ₹0.90 lakh and ₹1.22 lakh each (Magnam Set leads at ₹1.22 lakh), and together make up only **28.8%** of revenue across a 70-product catalogue. Revenue is spread widely rather than concentrated in a few items.

4. **Anniversary is the biggest occasion; Raksha Bandhan has the highest order value.**
Anniversary leads with 205 orders and ₹6.75 lakh. Raksha Bandhan earns ₹6.32 lakh from only 132 orders (**₹4,785 per order**, the highest). Evergreen occasions (Anniversary, Birthday, All Occasions) keep revenue going in non-festival months.

5. **Demand is spread across many smaller cities.**
Orders come from 86 customer cities. The leaders are Imphal (29 orders), Dhanbad (28), Kavali (27), Haridwar (24), Dibrugarh (21) and Bidhannagar (21). The top city holds only 2.9% of orders and the top five 12.9%, so no city dominates and the demand is mostly outside the big metros.

6. **Delivery time is inconsistent and unrelated to order size.**
The average is 5.53 days, but deliveries are spread almost evenly from 1 to 10 days: only **29.3%** arrive within 3 days and **31.9%** take 8 to 10 days. The correlation between quantity ordered and delivery time is 0.003 (essentially zero), so larger orders are not slower; the variation must come from other factors such as location or processing.

7. **Orders arrive around the clock, with an evening lift.**
Revenue by order hour ranges from ₹0.95 lakh to ₹1.86 lakh. The strongest window is 6 to 9 PM (₹1.73 to ₹1.86 lakh per hour), with a smaller bump at 6 AM (₹1.77 lakh). The pattern is fairly flat, so timing is a secondary lever compared with season and occasion.

7. Supporting figures

Revenue by order month

Month	Revenue	Orders
January	₹95,468	34
February	₹7,04,509	213
March	₹5,11,823	166
April	₹1,40,393	40
May	₹1,50,346	43
June	₹1,57,913	45
July	₹1,35,826	39
August	₹7,37,389	165
September	₹1,36,938	40
October	₹1,51,619	39
November	₹4,49,169	134
December	₹1,49,591	42

Orders and revenue by occasion

Occasion	Orders	Revenue	Per order
Anniversary	205	₹6,74,634	₹3,291
Raksha Bandhan	132	₹6,31,585	₹4,785
All Occasions	126	₹5,86,176	₹4,652
Holi	180	₹5,74,682	₹3,193
Birthday	149	₹4,08,194	₹2,740
Valentine's Day	113	₹3,31,930	₹2,938
Diwali	95	₹3,13,783	₹3,303

Revenue by category

Category	Revenue	Share	Per order
Colors	₹10,05,645	28.6%	₹3,684
Soft Toys	₹7,40,831	21.0%	₹4,463
Sweets	₹7,33,842	20.8%	₹4,291
Cake	₹3,29,862	9.4%	₹2,795
Raksha Bandhan	₹2,97,372	8.4%	₹3,004
Plants	₹2,12,281	6.0%	₹2,144
Mugs	₹2,01,151	5.7%	₹2,718

Delivery time distribution

Days to deliver	Orders	Share
1 to 3 days	293	29.3%
4 to 7 days	388	38.8%
8 to 10 days	319	31.9%

8. Recommendations

1. **Plan inventory and campaigns around four peaks.** Prepare stock and advertising three to four weeks before Valentine's Day, Holi, Raksha Bandhan and Diwali, since they bring over half of revenue.
2. **Fill the off-season with evergreen occasions.** Promote Anniversary and Birthday gifts in the eight quiet months, where monthly revenue is only about ₹1.4 lakh on average.
3. **Concentrate on Colors, Soft Toys and Sweets.** They bring 70% of revenue; upsell Soft Toys and Sweets (highest order value) and bundle low-value Plants and Mugs with them.
4. **Set and monitor a delivery standard.** A third of orders take 8 to 10 days; set a target (for example 3 to 5 days, faster for festival orders) and investigate delays by location and processing step.
5. **Keep growing in smaller cities.** Demand already comes from towns such as Imphal, Dhanbad and Kavali; localised campaigns there are likely to pay off.
6. **Schedule ads for the evening.** Place paid promotions between 6 and 9 PM, when order revenue is highest.

9. Data notes and limitations

- **Synthetic data.** Customer names and product descriptions are placeholders. Patterns such as festival products selling only in festival months and 100 customers placing 1,000 orders (about 10 each) reflect how the dataset was generated, so the findings should be validated on real data before real business decisions.
- **Revenue is Price × Quantity.** No discounts, costs or margins are included, so results describe revenue, not profit.
- **Average value per order.** The ₹3,521 KPI is revenue divided by 1,000 orders. Revenue per customer would be ₹35,210 because each of the 100 customers placed about 10 orders.
- **Single year.** One year of data cannot show year-over-year growth.
- **Two city fields.** The city chart uses the customer's city (86 cities); the orders table also has a delivery location (301 distinct values).

10. Skills demonstrated

> Power Query import of multiple files | Data modelling and relationships | Calculated fields and date arithmetic | Pivot Tables | Timeline slicers and slicers | Seasonality and occasion analysis | Correlation check | Dashboard storytelling

Note: this is an independent portfolio project using a public practice dataset. All figures in this report were verified against the dataset in the accompanying Excel workbook.
